

Provider Capacity Optimization & Scheduling Intelligence

Outpatient Healthcare Operations Analysis | Synthetic Multi-Location Dataset

Behavioral Health and Endocrinology Present Significantly High Wait Days

Behavioral Health Demonstrates Highest Provider Utilization

Behavioral Health and Orthopedics Experience Elevated No-Show Rates

Medicaid and Medicare Patients Face Additional Barriers When Accessing Care

Behavioral Health Demonstrates the Tightest Capacity Constraints

Operational Recommendations

- Expand Behavioral Health Capacity:** Behavioral Health demonstrated the longest wait times (46 days), highest utilization, and elevated no-show burden, suggesting provider demand exceeds scheduling capacity.
- Improve Appointment Adherence:** Target high no-show populations (Medicaid, Medicare, Behavioral Health) through automated reminders, telehealth, and flexible scheduling.
- Optimize Underutilized Capacity:** Primary Care, Orthopedics, and Physical Therapy demonstrated higher unused provider minutes, presenting opportunities for referral redistribution and schedule optimization.
- Prioritize Endocrinology Access Improvements:** Elevated wait times (38 days) suggest specialist access limitations requiring additional scheduling support or referral triage.
